

CMS Glossar (GRM internal)

Documentation about side-info in using the typo3 system

Topic	Info	Comment
Change of URL Segment	• always click on "revert redirects only"	
Footer und Metanavigation	• Maintenance in highest possible page tree position / section. General recommendation is to use Links (intern oder extern)	
Phone numbers	• phone numbers have to be without letters but with country code and "+" or "00" • Please allways use the tool to create both, linked number and also maintain the alt "field"	
DAM file Updates / Display file names	• Avenit coded a routine which constantly checks already imported files for updates so that contents as well as display names are updated on the website, too	
DAM PDF documents - direct doanload	• Provider Picturepark doesn't offer the possibility "direct download" at the moment	
Activation of Meta Menu	• Avenit owns Configs for activation of meta navigation. No Live-Release needed. For new trees it will be configured directly by Avenit.	
MBU content creation process	• content/page creation in local language but Typo3 language layer "EN". • Then copy/translate the content items to local language layer This prevents any issues when using the XLIFF translation process / module	
Garbage Collector	• live since May 2023. Runs daily 11 p.m. and checks Solr entries if the item is still available or not (404). If not, it will be deleted from the internal search index.	
Menu Mode – extend to four levels	• activated, then first level of the tree moves to the meta navigation level next to language selection drop down. Level 2-4 will be displayed in the main menu section.	

	• deactivated, Level 1-3 will be displayed beginning in the main navigation. No section selection will be possible.	
Content HUB setup in tree	• hier hatte die Seite, die ja nie direkt aufgerufen werden sollte und immer noindex,nofollow erhält, die gleich URL wie der Link auf die Detailseite. Durch das Processing von Typo3 werden erst Seiten gesucht die der URL entsprechen und später eventuelle Plugins. Dem kann einfach vorgebeugt werden, in dem der ContentHub Storage auf der gleichen Ebene und nicht als Kind der Detailseite (habe das für Group korrigiert) anlegt. Dann passen auch die Slugs.
